

Solar energy gives architectural freedom

This new project in the heart of Frederiksberg/Copenhagen shows again that the green transition does not have to be ugly, today solar cells are available in colours and shapes that can be implemented architecturally naturally in the urban environment, without inappropriate colours and annoying reflections that characterize standard solar cells today, with the new solar cells they can instead adorn the building.

- All types of roofs and facades can be an active element in the energy supply, while the architecture is completely free.

And the solar cells are made in Denmark.
